WOODGRO
TRADE MARK REG.

Pure Cow Manure

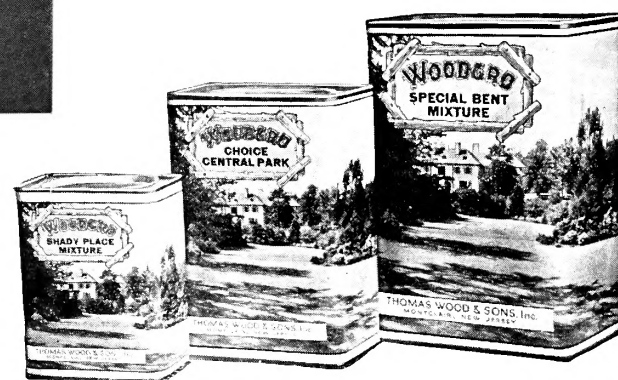

The greatest influence that WOODGRO has on plant-life is supplying organic matter to the soil. Its concentration, made possible by a special process of dehydration, makes it extremely valuable as a fertilizer. Upon decomposition of WOODGRO in the soil, it produces humus, which increases the absorptive capacity, acts as a binder in sandy soils, produces porosity in clayey soils. WOODGRO being dehydrated, increases the water-holding capacity of the soil, aids in the air-supply, renders compounds more available, and, by the addition of numerous bacteria, stimulates the processes of ammonification, nitrogen fixation, and nitrification. These effects are lasting and carry over from year to year.

The Difference Between WOODGRO and Other Fertilizers

The average organic fertilizer consists of dehydrated manures, which are more or less impure and contain large volumes of **useless filler**. WOODGRO, being pure cow-manure, concentrated, is fertilizer of the highest value, which stimulates plant-growth, and also adds humus to the soil.

LAWN GRASS SEED

WOODGRO SPECIAL BENT MIXTURE

Through many years of careful testing we have developed a super mixture of grasses, mostly Bent varieties, which will produce a smooth, velvety lawn resistant to drought and hard wear. The seed has been chosen for its freedom from dirt and weeds, its high vitality, and trueness to type. It weighs 25 pounds to the bushel, which is unusually heavy for Lawn Grass Seed and means that it is pure seed of the highest quality. A good lawn cannot be made from lightweight chaffy seed or seed mixed with dirt and foreign matter. Only the most carefully chosen stock, cleaned, recleaned, and tested, can be depended on for success.

Each package of Lawn Grass Seed contains detailed instructions for preparing the ground, sowing, fertilizing, and after care of new lawns, and reliable directions for improving an old one.

Lb. 70 cts., 2 lbs. \$1.40, 5 lbs. \$3.25, 10 lbs. \$6.00,
25 lbs. \$14.50, 100 lbs. \$55.00

We guarantee this mixture to contain 25% Creeping Bent

HOW TO MAKE A LAWN

Nothing is more universally admired and sought for by people of good taste and discrimination than a well-made, well-kept lawn. It is a priceless possession and requires intelligent effort and care. The main thing is to start right. The materials and foundation determine the quality of a lawn as much as of a building of brick and mortar. Use well-cleaned grass seed, consisting of a proper mixture of grasses suited to the locality and the particular location. Good seed makes a better lawn than sod. When the ground has settled and has been rolled firm, sow the seed evenly and thickly, at the rate of 5 bushels or 100 to 120 pounds to the acre. Choose a still day and make two sowings at right angles to each other, to insure even distribution. A light sifting of rich soil over the seed is beneficial, or it may be lightly scratched with a rake. Firm the surface afterward with a roller or by vigorous blows with the flat of the spade. If the sowing can be done shortly in advance of a light rain it is very fortunate, but, at all events, a newly seeded lawn should not be permitted to become dried out until the grass is up and fairly well established.

As soon as the new grass will engage the blades of the mower, cut it and keep it cut regularly. All lawns, even those that are well established, should be watered well in hot, dry weather. In order to maintain vigorous growth and to discourage weeds, old lawns should be reseeded lightly every season. This can be done in either spring or fall, and should follow a light raking. Two bushels, or 40 pounds, to the acre are sufficient, and it should be rolled or patted into the soil.

Be sure to sow grass seed in all holes where weeds have been dug. Should dead spots appear in the lawn, spade them up, working plenty of fertilizer into the soil, and sow seed at the rate of 1 pound for every 100 square feet, keeping the spots well rolled and watered. An annual application of Woodgro Cow-Manure or Woodgro Lawn and Garden Fertilizer should be given every spring, applying it at the rate of 1000 pounds to the acre.

Seed may usually be sown in the latitude of Montclair from March 20 to June 20, and from August 15 to October 15, preferably in the early spring or early fall, to get the benefit of the rains.

WOODGRO LAWN GRASS SEED

Advantages of Sowing Mixed Grass Seeds

A well-balanced combination of grasses will give better results than a separate variety. Various grasses in mixture will help crowd out weeds. Often a separate variety of seed will not thrive on certain soil but where there is a combination of seeds, one or more varieties in the combination will surely thrive and our formulas are so well blended that they will give very satisfactory results.

Woodgro Mixture for Shady Places

There are always spots under trees and in the shadow of buildings where the sun-loving grasses will not grow. For places of this kind we have prepared a careful Mixture of those grasses which naturally thrive in the shade. This Mixture consists of the highest grade of re-cleaned seeds, and should produce a good lawn in difficult shady places. Even shade-loving grasses will not grow under trees without being watered because the tree roots are very greedy and absorb the moisture from the surface quickly. Weighs over 20 pounds to the bushel. Lb. 65 cts., 2 lbs. \$1.25, 5 lbs. \$3.00, 10 lbs. \$5.50, 20 lbs. \$10.50, 100 lbs. \$50.00.

Woodgro Choice Mixture

In this Mixture the quantities of some of the more expensive grasses are reduced or left out. Produces a thick turf, well adapted to hard usage. Weighs over 20 pounds to the bushel. Lb. 50 cts., 2 lbs. 95 cts., 5 lbs. \$2.00, 10 lbs. \$3.75, 20 lbs. \$7.00, 100 lbs. \$34.00.

Sunny Spot Mixture

This mixture will meet the requirements of those desiring to maintain a lawn at low cost. It is a good clean mixture of high quality and strong germination, producing a fine turf. Lb. 30 cts., 5 lbs. \$1.40, 10 lbs. \$2.60, 100 lbs. \$25.00.

Woodgro Terrace Mixture

This is a special mixture of grasses best suited for sowing on terraces and side-hills—grasses that produce strong, spreading roots, thus preventing heavy rains from washing them out, that will withstand drought and exposure, thrive on shallow soils and at the same time produce a rich green turf throughout the season. Lb. 65 cts., 5 lbs. \$3.00, 20 lbs. \$11.00, 100 lbs. \$50.00.

Woodgro Seashore Lawn Grass Seed

WOODGRO

Flower Seeds

The bright blooming Annuals are the quickest and easiest of all flowers to raise. As their name indicates, they pass their entire existence within the compass of one year. The seed which you sow now germinates in a few days, produces plants which come into bloom, bear seed, and die before the approach of winter. Because of their short period of growth and their showy brilliance, they are extremely useful as fillers in gardens of bulbs, shrubs, or perennials, and also excellent for cutting.

Some Annuals are so hardy that their seed lives in the ground over winter and comes up year after year, so that they seem to be really perennials. The seed of other Annuals is tender and will not live outdoors over winter. These must be sown indoors early in spring and the little plants transferred to the open ground when the weather is warm.

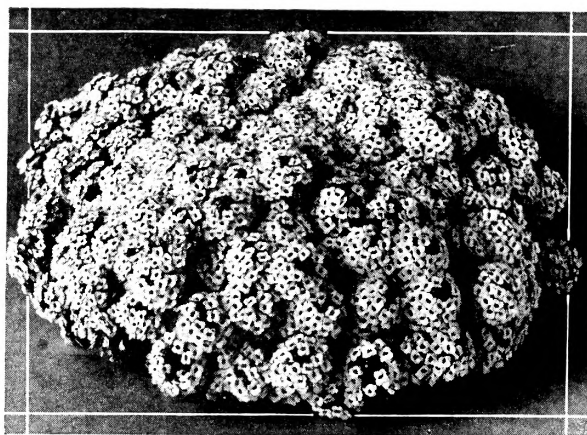

Practically all Annuals will bloom the first year if sown outdoors after the winter is settled, but some of them come into bloom a little late and so are better started in coldframes, hotbeds, or boxes indoors.

Almost all Annuals like rich soil, plenty of water, and bright sunshine. Dwarf varieties should be thinned to stand about 4 inches apart; taller varieties from 6 to 18 inches. Exceptional plants, like Cosmos, may require even more space.

Thorough cultivation while the plants are young and copious watering in dry weather will insure success.

Ageratum Blue Cap

Alyssum White Carpet

Unlike many bedding plants, these flowers are not likely to be spoiled by rain, nor do the colors fade out. Easily raised from seed, which is usually started in a hotbed or window and transferred to the open ground in May. Can also be sown outdoors in May.

BLUE CAP—Large, deep blue flowers.

Pkt. 15 cts., $\frac{1}{8}$ oz. \$1.00, $\frac{1}{4}$ oz. \$1.50.

SELECTED ASTERS

The main essentials in growing fine Asters are a new, rich soil, frequent cultivation, no check to their growth from start to finish, and ample room to develop. When long-stemmed flowers are wanted for cutting, the plants should be set out not closer than 1 foot apart in the rows and 2 feet between the rows. When wanted for mass effect in beds, they may be planted 9 to 12 inches apart each way. They should not be grown on the same ground year after year; it must be changed each season.

Asters are sometimes attacked by an aphid at their roots; also by stem-rot. To prevent this, treat your seeds with Semesan before planting; also give the soil a liberal dressing of tobacco dust.

EARLY WONDER—1½ ft. This is the best extra-early Aster. If sown indoors in March, can be had in blossom before the close of June. Sown in the open the end of April, will blossom early in July. Flowers quite double, of good size, are borne on long, stiff stems which makes them of great value for cutting.

WOODGRO

Selected Sweet Peas

CULTURE—It is a well-known fact that, in order to have largest blooms of Sweet Peas, seed must be planted early, so as to make the greatest root-development during early spring; many professional gardeners sow in pots and transplant in April, or sow the previous fall.

Sow seed as soon as the ground can be worked in the spring. Dig a trench about a foot wide and deep, and fill in with 6 inches of well-rotted stable manure; tread down firmly and replace the good garden soil. Draw a single straight line in the middle of the prepared surface, about $\frac{3}{4}$ inch deep; sow seed at even distances of about 3 inches and cover. When the plants grow about 3 to 4 inches high, thin out, leaving the plants 6 inches from each other. Experts who raise for exhibition thin out to one foot.

The Sweet Pea is a moisture-loving plant, and by the month of May the plants will require water. In order that the water may be retained by the soil and get to the roots, as well as keep them cool, it is advisable to use a mulch of Woodgro Cow-Manure and soak well each or every other day, as needed.

WOODGRO GLADIOLUS

Aristocrats of the Gladiolus Family

No other summer-flowering bulb has enjoyed more universal popularity, or has greater diversity of beauty. Our entire selection is established upon the basis of proved merit. You will not be disappointed by any of them. All our Gladiolus Bulbs have been chemically treated, as a protection against thrip, which has proved so disastrous in the past seasons.

CULTURE—Any good garden soil will grow Gladiolus well, provided they are planted in a sunny location. Bulbs should be planted 4 inches deep and at least 6 inches apart; frequent cultivation with a hoe or a weeder, around the base of the plant, to prevent the soil from becoming hard and dry, is advisable. Water copiously.

FEEDING—Gladiolus are gross feeders, and we find Woodgro Cow Manure is the most result-producing food. Apply it between the rows after the foliage has made a good start, and repeat the application every two weeks until the buds show. From that time on liquid Woodgro Cow Manure, applied every other day, produces splendid results.
